Presenter PC:	
1.1	Computer setup: 1. Participant setup: connect a monitor and keyboard for the participant. Ensure that the participant's monitor is configured as an extended display. 2. Experimenter setup: Ensure that a second monitor is available to display the experiment scripts (code/experiment/)
1.2	MATLAB scripts: open *ring_buffer.m* and *ptb_demo.m* in **two separate MATLAB instances,** not as tabs in the same instance (see picture below) 
1.3	1. Open Purr Data patch (red_noise.pd) 2. Activate audio processing using either the DSP toggle or the menu option (Medien → An). 3. To check that audio is working, select Medien → Teste Audio → Ausgabe-Geräte **Troubleshooting:** If the audio sounds distorted, check that the correct speaker system is selected. → Einstellugen → Ausgabe-Geräte → Lautsprecher 

Start	
2.1	1. Prepare the participant, fit the EEG cap and connect the amplifier 2. Start the EEG stream 3. Ensure that the stream's sampling rate matches the sampling rate configured in *ring_buffer.m* (default: 250 Hz)
	Simulation mode (optional) The experiment can be tested without a participant: 1. Dummy signal of the amplifier 2. Stream an existing dataset: Open a third MATLAB instance and run *new_streamer.m*. Select the dataset to stream in line 7 and run the script.
2.2	Start Online Analysis: run *ring_buffer.m*
2.3	Start the experiment: run *ptb_demo.m* 1. Check that the participant's monitor display Psyhctoolboox help screen and then the welcome screen 2. When prompted by the MATLAB command window, in the LabRecorder App, select all streams (EEG, AAA, EM, NFB) and start recording. 3. Click outside the Purr Data window to prevent participant's spacebar press from accidentally toggling Purr Data DSP 4. Inform the participant that they can begging by pressing the spacebar. 5. During the experiment, monitor participant's progress through the MATLAB Command Window **Troubleshooting:** if Purr Data displays the message "error: audio I/O stuck… closing audio": 1. Close and reopen Purr Data 2. Check that the audio system is working before continuing This error should not require re-starting the experiment or EEG recording.

Finalize the experiment	
3.1	**Important:** Follow the steps below in the specified order to ensure that the data can be reconstructed correctly offline. **1.** Stop the EEG streaming **2.** Wait for *ring_buffer.m* to terminate automatically - The MATLAB command window indicates where *chunksize.mat* was saved (line 13) - A plot should appear (see plot below), showing the last envelope. You can check whether the filter became unstable.  **3.** Stop LabRecorder **4.** Manually close the experiment using the escape key **5.** The MATLAB Command Window of *ptb_demo.m* indicates where the variables were saved (*score.mat, trial.mat, task.mat, thresh.mat and storage.mat*) - If it didn't run till the end, you need to run the last section to save those variables (line 2350). - Save these variables, they will get rewritten if you do another recording.
